

Brass paradox:  
 Set of players:  $\{1, \dots, 100\}$   
 Set of strategies:  
 $\{A \rightarrow C \rightarrow B, A \rightarrow B\}$   
 50 people using  $A \rightarrow C \rightarrow B$  and the other 50 people using  
 $A \rightarrow B$  is a pure strategy Nash equilibrium.  
 Average salary of each player = 150

Lecture 33

Strategy set =  $\{A \rightarrow C \rightarrow B, A \rightarrow D \rightarrow B, A \rightarrow C \rightarrow D \rightarrow B\}$

Claim:  $A \rightarrow C \rightarrow D \rightarrow B$  is a weakly dominated strategy

→ The delay of a player  $i$  using  $A \rightarrow C \rightarrow D \rightarrow B$  is  $(n - n_2) + (n - n_1)$

$$= 2n - (n_1 + n_2) = 200 - (n_1 + n_2)$$

→ Suppose player  $i$  deviates to  $A \rightarrow C \rightarrow D$ . Then its utility is

$$= (n - n_2) + 100 = 200 - n_2 \geq 200 - (n_1 + n_2)$$

All players playing  $A \rightarrow C \rightarrow D \rightarrow B$  is a NDSE.

Average delay = 200

Lemma: Let  $A \in \mathbb{R}^{m \times n}$  be a matrix. Let  $(i, j)$  and  $(h, k)$  be two PSNEs of the matrix game  $A$ . Then  $(h, j)$  and  $(i, k)$  are also PSNEs.

Proof:  $\underline{A[h, j]} \leq \underline{A[i, j]} \leq \underline{A[i, k]} \leq \underline{A[h, k]} \leq \underline{A[h, j]}$
